1. System overview

Component	Detail
Application server	Apache Tomcat 9 on Java 8, web application `petstore.war` at context `/petstore`, port 8080
Database	Apache Derby 10.14 (formerly Cloudscape), database `PetStoreDB` in `/var/petstore/db`, schema ESTOREUSER. Runs inside Tomcat; batch jobs connect through the Derby network server on port 1527.
Batch home	`/opt/petstore`: `batch/` scripts, `db/batch/` SQL, `conf/` settings
Output folders	`/var/petstore/backup`, `/var/petstore/extract`, `/var/petstore/log`
Job log	`/var/petstore/log/batch.log`, one line per job start and end

Java™ Pet Store Lite

Operations Runbook

Document	PSL-RB-01
Version	1.3.2-lite-1
Audience	Operations and Control-M schedulers
Scheduler	Control-M, data center DC_PSL_PRD, node psl-app01

2. Batch schedule

The schedule is defined in `scheduler/control-m/PSL_PETSTORE.xml` (two folders).

Job	Folder	When	Waits for	Script
PSL_DB_BACKUP	PSL_PETSTORE_DAILY	Daily 01:00	-	psl_db_backup.sh
PSL_AUDIT_EXTRACT	PSL_PETSTORE_DAILY	Daily 01:30	PSL_DB_BACKUP-OK	psl_audit_extract.sh
PSL_SIGNON_REPORT	PSL_PETSTORE_DAILY	Daily 01:45	PSL_AUDIT_EXTRACT-OK	psl_signon_report.sh
PSL_AUDIT_PURGE	PSL_PETSTORE_DAILY	Sunday 02:00	PSL_AUDIT_EXTRACT-OK	psl_audit_purge.sh
PSL_CATALOG_CHECK	PSL_PETSTORE_DAILY	Daily 06:00	-	psl_catalog_check.sh
PSL_ACCT_UNLOCK	PSL_PETSTORE_CYCLIC	Every 15 minutes, 00:00-23:59	-	psl_acct_unlock.sh

```
01:00 PSL_DB_BACKUP --> 01:30 PSL_AUDIT_EXTRACT --+--> 01:45 PSL_SIGNON_REPORT
                                                  +--> 02:00 PSL_AUDIT_PURGE (Sundays)
06:00 PSL_CATALOG_CHECK            every 15 min   PSL_ACCT_UNLOCK
```

3. Job details

3.1 PSL_DB_BACKUP

Online backup of PetStoreDB with `SYSCS_UTIL.SYSCS_BACKUP_DATABASE` (`db/batch/db_backup.sql`). The backup is moved to `/var/petstore/backup/PetStoreDB_YYYYMMDD`. Backups older than 7 days are deleted. Critical job: up to 2 reruns 10 minutes apart; on failure Control-M mails psl-ops and PSL_AUDIT_EXTRACT stays waiting.

3.2 PSL_AUDIT_EXTRACT

Exports yesterday's rows of SIGNON_AUDIT (00:00 to 24:00) to `/var/petstore/extract/signon_audit_YYYYMMDD.csv` for the security team (`db/batch/audit_extract.sql`).

Column	Content
1 audit_id	Event number
2 username	User name as typed
3 event_type	SIGNON_OK, SIGNON_FAIL, SIGNON_LOCKED, ACCOUNT_LOCKED, ACCOUNT_UNLOCKED, SIGNOFF, USER_CREATED
4 event_ts	Time of the event
5 remote_addr	Client address, or `batch:PSL_ACCT_UNLOCK`

No header row. The last line is a trailer `TRAILER,YYYYMMDD,<row count>`; the count excludes the trailer.

3.3 PSL_SIGNON_REPORT

Writes yesterday's counts per event type, the number of locked accounts and accounts per role to `/var/petstore/extract/signon_report_YYYYMMDD.txt`.

3.4 PSL_AUDIT_PURGE

Sundays only. Deletes SIGNON_AUDIT rows older than 90 days. It waits for that day's extract so no row is deleted before it is extracted.

3.5 PSL_CATALOG_CHECK

Runs catalog checks C1 to C4 (see the Administrator Guide). If the catalog tables do not exist it calls `http://localhost:8080/petstore/Populate?forcefully=false` to load the sample data, then checks again. Exit code 4 means a check found rows; Control-M mails psl-catalog. Details are in `/var/petstore/log/catalog_check.log`.

3.6 PSL_ACCT_UNLOCK

Every 15 minutes. Unlocks accounts locked more than 30 minutes ago, resets their failed attempts and writes ACCOUNT_UNLOCKED to the audit.

4. Exit codes and recovery

Code	Meaning	Action
0	OK	None
4	PSL_CATALOG_CHECK found bad catalog data	Catalog team fixes the data or an administrator reloads the sample data. Rerun the job.
8	SQL or file error	Read `batch.log` and the job log. Check that Tomcat is up (the Derby network server runs inside it) and that port 1527 answers. Rerun.

4.1 Restore from backup

1. Stop Tomcat.
2. Move `/var/petstore/db/PetStoreDB` aside.
3. Copy `/var/petstore/backup/PetStoreDB_YYYYMMDD` to `/var/petstore/db/PetStoreDB`.
4. Start Tomcat and open the store home page.

4.2 Rerunning the extract

The extract always covers the day before the run date. To re-extract an older day, run the export query in `db/batch/audit_extract.sql` by hand with the dates changed.

5. Settings

```
conf/env.sh              PSL_HOME, folders, PSL_DB_URL, retention days, psl_ij and psl_log
helpers
conf/petstore.properties database, sign-on rules, catalog and batch settings
```

Setting	Value
Audit retention	90 days
Backup retention	7 days
Unlock after	30 minutes
Database URL for batch	`jdbc:derby://localhost:1527//var/petstore/db/PetStoreDB`
